## CLOUDMESH PACKAGE

### 1.1 Subpackages

#### 1.1.1 cloudmesh.analytics package

##### Subpackages

##### cloudmesh.analytics.api package

##### Submodules

##### cloudmesh.analytics.api.manager module

```
class cloudmesh.analytics.api.manager.Manager
    Bases: object
    list (parameter)
```

##### Module contents

##### cloudmesh.analytics.command package

##### Submodules

##### cloudmesh.analytics.command.analytics module

```
class cloudmesh.analytics.command.analytics.AnalyticsCommand
    Bases: cloudmesh.shell.command.PluginCommand
    do_analytics (args)
```

Usage:

```
analytics server start [--cloud=CLOUD]
analytics server stop [--cloud=CLOUD]
```

This command manages the cloudmesh analytics server on the given cloud.  
If the cloud **is not** spified it **is** run on localhost

(continues on next page)

(continued from previous page)

```
Options:
  --clout=CLOUD  The name of the cloud as specified in the
                  cloudmesh.yaml file
```

### Module contents

#### cloudmesh.analytics.server package

##### Submodules

##### cloudmesh.analytics.server.db module

```
cloudmesh.analytics.server.db.close_db(e=None)
cloudmesh.analytics.server.db.get_db()
cloudmesh.analytics.server.db.init_app(app)
cloudmesh.analytics.server.db.init_db()
```

##### cloudmesh.analytics.server.server module

To create a flask app

**The method definition to create a flask app by call ing the create\_app function**

**Example:** create\_app(test\_config)

```
cloudmesh.analytics.server.server.create_app(config=None)
```

To create a flask app

**Parameters** **config** – A dictionary contains the configurations for the flask app

**Returns** A flask app object

### Module contents

##### Submodules

##### cloudmesh.analytics.analytics module

The analytic functions The module include analytic functions, and are also the endpoints of the flask app. Those functions are referred by the OpenAPI specification by operationIDs

```
cloudmesh.analytics.analytics.kmeans_fit(file_name, body)
cloudmesh.analytics.analytics.linear_regression(file_name, body)
```

Linear regression.

**Parameters**

- **file\_name** (*str*) – The file name that has the input data.
- **body** (*dict*) – The request body, which is a dictionary mapped by the connexion.

**Returns** Return an json objects.

**Warning:** The input format should be specified

```
cloudmesh.analytics.analytics.pca()
```

### cloudmesh.analytics.file module

File operations The module include file operations

```
cloudmesh.analytics.file.list()
```

List all uploaded files

```
cloudmesh.analytics.file.read(file_name)
```

Read files given a file name.

**Parameters** **file\_names** – The input data source.

**Returns** Return a json response.

```
cloudmesh.analytics.file.upload(file=None)
```

Upload files to the server ;param file: A file stream

**Returns** Return the file name if it success

**Attention:** Only support the csv format now.

**Raises** **Raise an error message if the file format is not supported –**

### cloudmesh.analytics.file\_helpers module

The helper function isolates non-endpoint function from the file module

```
cloudmesh.analytics.file_helpers.allowed(file_name, allowed_extensions)
```

The allowed file extensions

**Parameters**

- **file\_name** – The file name to check
- **allowed\_extensions** – The allowed file extensions

**Returns** Return true or false

```
cloudmesh.analytics.file_helpers.read_csv(file_name)
```

Read csv using panda. The source path is relative and set when initializing flask app.

**Parameters** **file\_name** – The file name to read

**Returns** A numpy array

```
cloudmesh.analytics.file_helpers.save(file)
```

Save file after securing the file name

**Parameters** **file** – the input data source

**Returns** Return a json response

## Module contents

### 1.2 Module contents

## TESTS PACKAGE

### 2.1 Submodules

### 2.2 tests.conftest module

The configuration for tests The config is required by the pytest. The pytest will run this file at first.

```
tests.conftest.app()
```

Configure the flask app for testing

This is a pytest fixture

**Attention:** The the database is in progress, and not used. All files are saved in the folder defined in the 'UPLOAD\_FOLDER' in the app configurations

**Warning:** The uploaded folder is relative to where the pytest is called. Calling pytest in other folder will result a mis- placed uploaded folder. The uploaded folder should be kept under test directory

```
tests.conftest.client(app)
```

The test client for simulating requests

**Returns** Return a test client

```
tests.conftest.runner(app)
```

**Attention:** Not used now

### 2.3 tests.test\_cloudmesh module

Test the functions in *cloudmesh.analytics.analytics*

**Tip:** Running the test under the cloudmesh-analytics directory

```
`> ./cloudmesh-analytics$ pytest`
```

**class** tests.test\_cloudmesh.TestFileOperations

Bases: object

Test file operations

**Attention:**

1. The function will be ran first and the files uploaded will be used for other tests
2. The uploaded file is insulated and saved in the testing\_files directory as indicated in *tests.conftest*

**post\_file** (*client, path, name*)

A helper function to make post request

**Parameters**

- **client** – The pytest fixture defined in *tests.conftest*
- **path** – The rest api defined in the yaml file
- **name** – the file name to post

**Returns** The data attribute of the flask response object

**pytestmark** = [Mark(name='first', args=(), kwargs={})]

**test\_format\_error** (*client*)

The upload will failed due to the txt file format. An error message will return

**Parameters** **client** – The pytest fixture defined in *tests.conftest*

**Returns** The data attribute of the flask response object, which is a binary string that includes a list of uploaded file names

**test\_read** (*client*)

Test read uploaded file using the rest api

**test\_success\_upload** (*client*)

Test upload. The file will be uploaded in to the current directory named files

The test sample will use a empty csv file called test upload

**Parameters** **client** – The pytest fixture defined in *tests.conftest*

**Returns** The data attribute of the flask response object, which is a binary string that includes a list of uploaded file names

**test\_success\_upload\_dabetes** (*client*)

Test upload. The file will be uploaded in to the current directory named files The test sample will use a empty csv file called test upload

**Parameters** **client** – The pytest fixture defined in *tests.conftest*

**Returns** The data attribute of the flask response object, which is a binary string that includes a list of uploaded file names

**test\_success\_upload\_sample** (*client*)

Test upload. The file will be uploaded in to the current directory named files

The test sample will use a empty csv file called test upload

**Parameters** **client** – The pytest fixture defined in *tests.conftest*

**Returns** The data attribute of the flask response object, which is a binary string that includes a list of uploaded file names

```
class tests.test_cloudmesh.TestKMeans
```

```
    Bases: object
```

```
    test_errors (client)
```

Testing error arguments. The exception raised by the sci-kit learn will be returned in the error message.  
The exception also raised by the filename doesn't exist in app.config['UPLOAD\_FOLDER'] :param client:  
:return:

```
    test_kmeans_fit (client)
```

```
class tests.test_cloudmesh.TestLinearRegression
```

```
    Bases: object
```

```
    test_errors (client)
```

Testing error arguments. The exception raised by the sci-kit learn will be returned in the error message

**Parameters** *client* – The pytest fixture defined in `tests.conftest`

**Returns** The data attribute of the flask response object, which is a binary string that includes a list of uploaded file names

---

**Note:** The server will return the error message raised by the sci-kit learn

---

```
    test_linear_regression (client)
```

Testing error arguments. The exception raised by the sci-kit learn will be returned

The data is taken from the sci-kit learn built in samples.

**Parameters** *client* – The pytest fixture defined in `tests.conftest`

**Returns** The data attribute of the flask response object, which is a binary string that includes a list of uploaded file names

**Warning:** Todo: The assertion may be false due to the floating number representaion in different word-size systems

```
tests.test_cloudmesh.teardown_module()
```

Teardown any state that was previously setup Remove the test\_upload\_folder by the end of tests

```
tests.test_cloudmesh.test_run_pca(client)
```

## 2.4 Module contents

## REQUIREMENTS

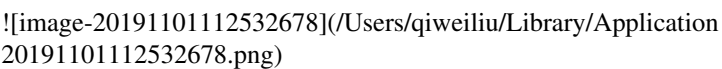

### 3.1 Local Cloudmesh Command

1. using cloumesh command to start and stop the remote server?
2. how to deploy the project?

### 3.2 TODO

1. A cloudmesh client will communicate with the server
2. A cloudmesh client is required
3. 12 functions are needed functionality
4. Exposing more service
5. Stop watch for testing
6. Set up docker and migrate to the cloud

2019.11.01. 11:19:18

1. use the command generate tool?
2. Support/typora-user-images/image-20191101112532678.png)
3. migrate the analytics folder to somewhere else
  1. The folder structure

The goal is to generate open api and

```
cms analytics run linear-regression -data = file.csv -intercept=true
```

1. Match the function name and parameters
2. Call the function matching the user input
  1. Return error raised by sklearn
